

### **Team Project: HTML & CSS**

Write clean, semantic markup in HTML code to define the content of your webpage. It will probably be a good idea to have different html files for the subpages. No JS using the `<script>` tag or CSS using the `<style>` tag should be included in your HTML code for this assignment. Any of these two tags used will be penalized.

Define the presentation, and layout of your webpage using CSS. All pages must reference one or more external CSS3 stylesheets. Your web pages must be responsive. They must compress cleanly or change the layout to fit on narrow screens. (3 configurations required: Desktop, Tablet, Phone) Embedded, or inline CSS is not allowed and will be penalized. All pages should use reasonable styles. You will not be graded on your choice of colors, but don't put white text on a white background (or something equally in poor taste)! (penalties of 1-5 points for poor choices, so don't do it!)

You should have fun with this assignment and are encouraged to put funny (but respectful) items in your web site.

You will only be graded on the html, and CSS for this deliverable, but feel free to implement JS along with your html/css code if you prefer to do so.

The submission should be a zip file including all your html, css, and image files. Use index.html for your home page. There should also be links to navigate to all your html files starting from index.html.

Every team should only have one submission, but include the names of all the members that contributed.

Good luck!
